## Planning & Procedure

- The Leader asks questions and makes the toasts. In telling the story, each participant takes a turn, in rotation, reading the paragraphs.
- In the opening paragraph on page 1,  $n = (\text{present year}) - 1,969$
- An extra wine glass is used as the *Cup of Remembrance* and is filled for the toast on page 8. The wine in this cup is not consumed.
- Four participants are pre-selected to read the parts of *Narrator*, *CAPCOM* (*capsule communicator*), *Neil Armstrong*, and *Buzz Aldrin*. (Pages 11-14).

## Structure & Timing

The ceremony is comprised of four parts separated by dinner:

- I. Introduction and Foreword
- II. Prelude: Genesis and history that led up to the space age.
- III. The Journey of Apollo 11.  
— Dinner
- IV. Epilogue  
— Dessert<sup>1</sup>

Part I thru III takes about 45-60 minutes.

Part IV takes about 5 minutes.

## Requirements

1. A single, central candle and holder (located at the table of the leader).
2. A candle in a candle holder for each participant and the leader.
3. Wine (or equivalent) for each participant and leader.
4. An extra wine glass for each table.<sup>2</sup>
5. A serving of seeds<sup>3</sup> for each participant.
6. A small serving of fish<sup>4</sup> for each participant.

---

<sup>1</sup>The dessert is a short cake (or equivalent) baked in the shape of the infinity sign.

<sup>2</sup>This is the *Cup of Remembrance* used for the toast on page 8.

<sup>3</sup>The seed could be peanuts, almonds, etc.

<sup>4</sup>The fish could be herring, tuna, smoked salmon, etc.

# Introduction

On July 20th of each year, we gather to commemorate the wondrous accomplishments achieved by the Human Beings of Planet Earth.

During this celebration we retell the story of the evolving universe, life, and the first landing by humans on the moon of Earth.

What better time to tell the story of our aspirations and accomplishments than on the anniversary of the highest achievement of our hands, hearts, and minds and one of the most dramatic events in modern time, that first landing.

Of all the formal holidays celebrated by the people of Earth, few, if any, recognize the peaceful and productive technological achievements accomplished by human beings as individuals, or as a species.

This, then, is our opportunity:

- to tell the story of the species that not only dreams, but has the ability to make those dreams a reality.
- to honor those who advanced our body of knowledge and to recognize the profound significance of thought, reason, and the methods of science.
- to become aware of the new and exciting possibilities that technology, derived from our understanding of nature, is opening up to us.

## Foreword\*

Five hundred million years ago, the moon summoned life out of its first home, the sea, and led it onto the empty land. For as it drew the tides across the barren continents of primeval earth, their daily rhythm exposed to sun and air the creatures of the shallows. Most perished — but some adapted to the new and hostile environment. The conquest of the land had begun.

We shall never know when this happened, on the shores of what vanished sea. There were no eyes or cameras present to record so obscure, so inconspicuous an event. Now, the moon calls again — and this time life responds with a roar that shakes earth and sky.

When the Saturn V soars spaceward on nearly four thousand tons of thrust, it signifies more than a triumph of technology. It opens the next chapter of evolution.

No wonder that the drama of a launch engages our emotions so deeply. The rising rocket appeals to instincts older than reason; the gulf it bridges is not only that between world and world — but the deeper chasm between heart and brain.

— Arthur C. Clarke

*When We First Left Planet Earth*

## PRELUDE

*(All gather around the table. The cups are filled)*

**Leader:** Why is July 20th different from all other days?

On this day, (n\*) years ago, humans first set foot on another world; the moon of Planet Earth. We are gathered here today to celebrate that event, and reflect upon its significance.

**Leader:** Why is this event so significant to us?

Prior to that day, life on Earth, while thriving in a myriad of environmental niches, or homes, was confined to that one world by the bonds of gravity. This was the first journey to another world by Humans, and the first step toward Earth-based life reaching an infinity of possible new homes in the unimaginable vastness of the universe.

It was a dramatic demonstration of Humankind's unique ability to formulate abstract concepts that accurately describe the phenomena of the Universe and to build machines to take advantage of those insights. As we add to our knowledge we continue to fulfill our natural destiny in understanding the Universe and our role in it.

**Leader:** How did this fulfillment begin?

About 14 billion years ago the Big Bang happened. In the earliest seconds, symmetries were broken and the forces of nature came into being. Particles joined to form atoms, atoms formed molecules. As the universe continued to expand and cool, stars came into being.

---

\* n = (present year) minus 1,969

At the end of their lives, in explosions that are among the most energetic events in the universe, the stars produced the heavier elements. More stars were born from the new elements and eventually planets formed around them. And the planets were abundant with the elements created by the earlier stars.

In the presence of energy from a local star, elements combined to form complex molecules including amino acids, the building blocks of life. In the eons that followed, the relentless stream of energy from the star drove chemical evolution on the nearby planets, and then biological evolution on at least one of them.

**Leader:** We light this candle to symbolize the Sun, our source of free energy.

*(Light the Central Candle )*

After a while, at a place and time when conditions were right, on the planet we call Earth, the third from the Star we call Sol, a carbon-based molecule came about that could replicate itself. Within its double-helix structure was embodied a chemical code; instructions that generate living organisms. We call this molecule deoxyribonucleic (de ok' si ri' boe new kle' ik) acid, or DNA.

**Leader:** Why is DNA important?

DNA is the basis of life, as we know it, and allows life on Earth to reproduce and evolve. It is found in the nucleus of every living cell.

*(Distribute the seed)*

**Leader:** The seed is the domain of the DNA and a symbol of life's potential. As we eat the seed let us reflect on the significance of the emergence of DNA and its importance to life as it evolved on Earth.

*(Eat the seed)*

**Leader:** Let us lift our glasses to the evolution of DNA.

Life began in the oceans of Earth, very early in the existence of the planet. Using the energy around them and the ability to reproduce and adapt to changes in their environment, the first simple life forms were able to prosper and multiply. Life produced order from chaos, locally reducing entropy.

First, as single-cell organisms, then as colonies of specialized cells, life took form with ever-increasing complexity. Responding to changes in the environment and other challenges to existence, life became varied and versatile.

Eventually, some explored, and then inhabited the dry environments beyond the ocean. As time went on, Life continued to fill all possible homes it could occupy, being bound only by gravity and the upper reaches of Earth's atmosphere.

*(Distribute the fish)*

**Leader:** The fish represents the early forms of animal life. As we eat it, let us reflect on the progression from simple life forms to ones more complex, driven by Life's ability to adapt to occupy every possible home and way of living.

*(Eat fish)*

**Leader:** Let us lift our glasses to Life coming forth from the seas to the land.

**Leader:** How did we evolve from those early life forms?

Life covered the land and filled the air and the seas. Those which best adapted to changes and challenges in the world about them thrived and multiplied.

As single cells joined together to form complex organisms, so complex life forms joined together in groups which gave each member a greater chance of survival. Thus, cooperation evolved as a favorable characteristic.

From one of these groups emerged a species that could judge distances by sight, had hands that could hold and grasp, walked upright, and could know and understand the world about them. These were our early ancestors who harnessed fire, made and used tools, and became aware of their own existence. Intelligence had evolved as a favorable characteristic.

**Leader:** We are the children of our parents, the descendents of ancestors, ancient and forgotten. Each of us is directly linked, by an invisible thread of heredity that disappears into the depths of time, binding us not to just our ancestors, but to the earliest forms of life, which thrived in the oceans and basked in the sunshine of the earliest days of planet Earth. Even further, to the stars themselves, where the very atoms that today form our bodies, were forged.

**Leader:** We light the candles to remind us that the processes which yielded the ever more complex and diverse forms of life, leading ultimately to us, were driven by the energy from our home star, the Sun. And we, as living beings, carry a flame of life that started as a spark in the distant past that has been passed, generation after generation, down through time.

*(The lit Central Candle is used to light the candle of the first guest in the direction of the reading rotation. The flame then progresses around the table(s) by lighting each guest's candle from the previous candle and ends at the candle of the Leader.)*

**Leader:** Let us lift our glasses to life and humanity's uniqueness among all life forms.

**Leader:** How did we develop the tools which would allow us to ultimately leave our birth planet?

Our species developed belief systems that gave meaning to the unexplainable and rules that organized social interaction. Eventually, within a paradigm where life was seen as a cycle of birth, death, and reincarnation, an idea—that we are here only once—was introduced. With that came an awareness of, and a reverence for, the preciousness of life which inculcated a sense of urgency that motivated, and ultimately drove, innovation and achievement.

We invented agriculture and economic systems, and developed cities that allowed specialization and transference of resources. These inventions provided sufficient time to allow some to think about the workings of the world and to further develop the mind's tools of writing, mathematics, and philosophy.

At first, our understanding of the universe was limited. Some placed themselves at its center and believed that all existence, including our own sun, revolved around them. Then, Copernicus (co per' na kas) reasoned that the Earth and other planets revolved around the sun.

As time went on, the scientific method was developed by Bacon, Galileo, and others, in which theories were formulated to fit observed facts rather than distorting reality to fit preconceived ideas.

Using the new methods of science, the workings of the universe began to be revealed. Kepler discovered that the planets travel in ellipses, rather than circles, which led to his laws of planetary motion.

Newton provided profound insights into the relationship between matter, force, and acceleration, and contributed the laws of inertia and the law of universal gravitation.

These explained the motion of both earthly and planetary objects in a rigorous mathematical way. In addition to inventing the reflecting telescope and explaining the white-light spectrum, Newton founded the modern science of physics and, concurrently with Leibnitz (Leap' nits), originated the calculus.

Gutenberg's invention of the printing press allowed the new wisdom to be made available to many people. This, in turn, sped the advancement of knowledge.

The structure of the matter of the universe was being understood. With the insights of Mendelyev (men dye lye' ef), the relationships among the elements were seen in an orderly and systematic way. With this knowledge, embodied in what is called *The Periodic Table of the Elements*, came the ability to understand and control chemical processes.

The theories of Coulomb (ku' lom), Gauss (gous), Ampère, Faraday, Maxwell, and others, expanded our understanding of electricity and magnetism. Kelvin, Joule (jewel), Carnot, (car no') and others developed the theories of thermodynamics which related heat and mechanical energy and the conversion of one into the other.

With the new theories of physics, technologies developed which included Watt's steam engine and Franklin's electricity. The concept of interchangeable parts allowed mass production which ushered in an era known as the *Industrial Revolution*. Technology abounded and produced a great wealth of resources which brought forth new discoveries yielding yet more technological advances.

Observations of the natural world, coupled with the scientific method, led Darwin to propose a theory in which the processes of nature alone explained the development and diversity of all of earthly life, including ourselves. This gave us a new perspective on our place in the universe.

Einstein developed the Theory of Relativity and with Curie, Bohr, Dirac (di rak'), Heisenberg, Schrodinger (shre' ding er), and others, contributed to the Quantum Theory. This refinement of Newton's theories provided new understanding about the relationship of space and time, and the interchangeability of matter and energy. This gave us access to the virtually unlimited resource of the power of the atom.

**Leader:** What part did these developments play in our leaving Earth?

The discoveries and new knowledge of the scientists provided the basis for the technologies that eventually allowed us to leave the planet. The theories of physics, chemistry and thermodynamics provided the basis for the engines that powered our machines on Earth and beyond.

The Wright brothers, von Karman, and others, developed the technology of aerodynamics which allowed the beginning of controlled travel away from the surface of our planet.

Edison, Tesla, Bell, Marconi, Armstrong, and others, provided ideas and creations from which the electronics and communications industry would rise. This led to the invention of television, by Baird, which provided the means to see from afar and brought the world community closer together.

Based on the work of Turing and von Neumann (noí´ man), computers would ultimately allow us to design machines, compute trajectories, and control our rockets and space vehicles.

Tsiolkovski (tseel kov´ ski) in Russia, Goddard in America, and Oberth in Germany, independently developed the theoretical basis for rocketry. A half century before the launch of the first satellite Tsiolkovski offered the prophetic insight: *The Earth is the cradle of mankind, but one cannot live in the cradle forever.*

Building on the theoretical foundations established by Goddard, the development of modern rocket technology was led by von Braun and Korolev . With his vision, technical abilities, and political skill, von Braun would shape and drive the American Space Program from post World War II through the Apollo era.

**Leader:** Let us lift our glasses to honor those whose work advances scientific and technical knowledge as they contribute to the *betterment* of humankind.

**Leader:** How did we finally send men to land on the Earth’s moon and return?

Twelve years before the event we recall tonight, the Space Age began. On October 4, 1957, a rocket was launched by the Soviet Union which placed the first artificial satellite, named *Sputnik*, in orbit about the Earth. A few months later the United States launched its first satellite, named *Explorer I*. After the passage of a little more than three years, the Russian Yuri Gagarin became the first human to orbit the Earth, with the American John Glenn following a few months later.

A contest had developed between two of the great nations of Earth. In what was to become known as the *Space Race* each would try to demonstrate their superiority over the other through technical achievement and vying for "firsts." It became clear that the ultimate victory would go to those who were first to land a man on the Moon.

In 1961, eight years before the landing, the American leader, President Kennedy, committed the American Nation to the goal of, within the decade, placing a man on the Moon and returning him safely to Earth. His speech, given at Rice University in Houston, Texas, echoed the human desire for adventure, challenge, and exploration:

‘But why’ some say, ‘the Moon?’ And they may well ask, ‘Why climb the highest mountain? Why thirty-five years ago fly the Atlantic? Why does Rice play Texas?’ We choose to go to the Moon!

We choose to go to the Moon in this decade and do the other things not because they are easy, but because they are hard. Because that goal will serve to organize and measure the best of our energies and skills. Because that challenge is one that we’re willing to accept, one that we are unwilling to postpone, and one that we intend to win.

The American manned journeys into space started with Project Mercury whose astronauts utilized a small, one-man capsule. The missions of Project Mercury began cautiously, but grew in complexity as confidence built that humans could not only survive in space but could actually command their craft.

Shortly afterward came Project Gemini with its spacecraft that carried two humans. The Gemini program flew missions to prepare for the lunar expedition.

On one mission, an astronaut left the spacecraft protected only by his space suit. This built confidence that an astronaut could function independently from his spacecraft when the time came to walk on the Moon.

On another mission, the astronauts remained in Earth orbit for 14 days to test their endurance of weightlessness for a time equivalent to that required for the journey to the Moon and back.

On many of the missions the astronauts would maneuver their Gemini spacecraft to rendezvous and dock with another Earth-orbiting vehicle which developed the techniques and skills necessary to meet in orbit. This would ultimately be used during the journey to the Moon.

During this time, robot spacecraft orbited and landed on the Moon providing vital information about that world. This was the beginning of what would be called *The Golden Age of Planetary Exploration* when robot spacecraft would be sent to observe almost all of the planets, and the moons of the planets, of Sol's System.

While Gemini was flexing the muscles of our new space capabilities, engineers were developing the launch system for Project Apollo that would be mighty enough to break the bonds of Earth's gravity and deliver 50 tons of spacecraft, and the astronauts, to the Moon.

It was called the Apollo/Saturn V (five). It was a magnificent, multi-staged, rocket that stood 365 feet tall and, at launch, weighed 6.5 million pounds. The payload it would loft into space was comprised of a conically-shaped capsule called the Command Module which was the living quarters for the three-man crew, the Service Module which provided life support and propulsion, and the Lunar Module (LEM) for transit to and from the Moon's surface.

Then, tragedy.

In heroic endeavors that push the boundaries of the unknown, some are called to make the ultimate sacrifice. In one such event, three astronauts — Grissom, White, and Chaffee — lost their lives when a fire broke out in their Apollo capsule during a mission rehearsal on the launch pad. But from the ashes arose a new design for the Apollo which yielded the superb machine that would ultimately safely carry men to the Moon and back home.

**Leader:** All rise.

*(The Remembrance Cup is filled)*

**Leader:** We pour an extra glass of wine in remembrance of those who gave their lives in the quest for knowledge. Let us now raise our cups to honor them. But to symbolize our loss, we do not drink.

We recognize that exploration is often accompanied by great risk. We raise our cups to the courage, and to the memory, of all who have given their lives seeking the far horizon and, in so doing, make it safer for those who follow.

*(A moment of silence is observed)*

**Leader:** Please be seated.

In December of 1968 the mission of Apollo 8 became the first manned expedition to the region of the Moon. Astronauts Borman, Lovell, and Anders, traveled to the Moon, orbited ten times, and then returned to Earth. For the first time in the history of the universe, humans broke the bonds of Earth's gravity and were captured by the gravitation of another world.

Building on the lessons of Gemini, Apollo 9 orbited the Earth and proved the ability of the astronauts and the systems of the Command and Lunar Modules to first separate, and then rendezvous and dock.

Apollo 10 flew to the moon and further tested the systems and procedures in a dress rehearsal for the lunar landing of Apollo 11—the mission that would irrevocably mark the time when life from Earth first reached another world.

## THE JOURNEY OF APOLLO 11

**Leader:** What were the events of that historic mission?

July 16th, 1969 was a hot, humid day at Cape Canaveral, Florida, USA. The Saturn V was poised on its launch pad with all systems "go." Aboard Apollo were three astronauts, Mission Commander Neil Armstrong, Command Module Pilot Michael Collins, and Lunar Module Pilot Edwin Aldrin.

People around the world pondered the significance of what was about to happen as they watched television or listened to radio. With excitement building, they waited as the seconds ticked away towards lift-off. An age-old dream was about to become reality.

Twelve . . . Eleven . . . Ten . . . Nine . . .  
 Ignition sequence starts . . .  
 Six . . . Five . . . Four . . . Three . . . Two . . . One . . . Zero,  
 all engines running.  
 LIFT-OFF! We have a lift-off, thirty-two minutes past the hour.  
 LIFT-OFF ON APOLLO ELEVEN . . .  
 Tower cleared.

In what was to be a perfect launch, the mighty Saturn, taming two hundred million horsepower, thundered from the launch pad and slowly accelerated piercing the thin clouds at 16,000 feet. Twelve minutes into the historic mission, traveling at five miles per second, the Apollo and Saturn third stage entered a 118 mile-high Earth orbit.

At two hours and forty-four minutes into the mission the third stage re-ignited its engine and accelerated the Apollo to seven miles per second — escape velocity! It now had the speed necessary to outrun the influence of Earth's gravity on a trajectory that would take it to the Moon.

At three hours and seventeen minutes, 5,600 miles from Earth, the mated Command Module and Lunar Module separated from the Saturn third stage. Apollo then maneuvered and left the S-IVB (S-4-B) third stage forever, its task complete. The Saturn V had performed admirably.

**Leader:** Let us toast the success of the Saturn V and those who made it possible.

The journey from the Earth to the Moon would take three Earth days. At two and a half days (61 hours, 40 minutes), the spacecraft passed the equipotential gravity point between the Earth and the Moon after which it rapidly accelerated toward the new world.

At 75 hours, 6 minutes, the Service Propulsion System engine was fired to slow the Apollo to allow it to be captured by the gravity of the Moon. It first entered an elliptical lunar orbit of 70 by 194 miles. Five hours later the orbit was lowered to 62 by 76 miles.

Once established in orbit, the Lunar Module and its systems were checked out in preparation for the descent to the Moon. At 100 hours into the mission, with Armstrong and Aldrin aboard the Lunar Module *Eagle*, named after a bird that was the symbol of the nation that built it, and Collins aboard the Command Module *Columbia*, the two spacecraft separated.

*(Designated participants read the following)*

**CAPCOM:** Eagle, Houston. We're standing by. Over . . .

Eagle, Houston. We see you on the steerable. Over.

**Aldrin:** Roger. Eagle. Stand by.

**CAPCOM:** Roger. How does it look?

**Aldrin:** The Eagle Has Wings!

**Narrator:** As *Columbia* continued in lunar orbit, the *Eagle's* historic descent to the surface of the Moon began. The *Eagle's* descent engine fired briefly to place it in a 68 by 10 mile orbit. At 102 hours, 33 minutes, 4 seconds, the reaction control system fired for seven seconds to settle the propellants in their tanks. Then the final descent burn began. As the *Eagle's* velocity slowed, it descended on an arcing trajectory toward its destination, the Sea of Tranquility.

When the Eagle reached a point 400 feet above the lunar surface on its continuing descent, it was angled 11 degrees from vertical for the final approach. The world listened to the words coming from distant space charting the progress of the landing craft and its intrepid crew.

**Aldrin:** . . . Thirty-five degrees. Thirty-five degrees . . .

Seven fifty, coming down at twenty-three . . .

Seven hundred feet, twenty-one down, thirty-three degrees . . .

Six hundred feet, down at nine-point-eight forward . . .

Three hundred fifty, down at four . . .

Three hundred thirty, three and a half down.  
We're pegged on horizontal velocity . . .

Three hundred feet, down three and a half . . . Forty-seven forward  
. . . Down one a minute. One and a half down . . .

— seventy. Got the shadow out there . . .

— fifty, down at two and a half. Nineteen forward . . .  
Altitude-velocity lights . . . Three and a half down,

Two hundred twenty feet. Thirteen forward... Eleven forward,  
coming down nicely . . .

Two hundred feet, four and a half down . . . Five and a half down . . .

One hundred sixty. Six and a half down, five and a half down,  
nine forward . . . Five percent . . . Quantity light . . .

Seventy five feet, things looking good . . .

Down a half. Six forward . . .

**Narrator:** At this point, Eagle was very close to the Moon. The success of the landing was now dependent on Armstrong's visual piloting ability. This was complicated by the descent-engine exhaust which was kicking up radial fans of dust that obscured his view. As the craft passed 60 feet, it was critically low on propellant. There remained, for the descent, one minute of fuel.

**CAPCOM:** 60 seconds.

**Aldrin:** . . . Lights on. Down two and a half.

Forward . . .

Forward . . .

Good . . .

Forty feet, down two and a half . . .

Kicking up some dust . . .

Thirty feet. Two and a half down . . .

**Narrator:** Armstrong had to be careful in these last few critical seconds to make sure that there were no boulders in the landing area or sideways velocity on the vehicle as it settled into the surface. A tipped lander would mean death.

**Aldrin:** Faint shadow . . .

Four forward . . .

Four forward. Drifting to the right a little.

Six . . . Down a half . . .

**CAPCOM:** 30 seconds.

**Armstrong:** Forward drift?

**Aldrin:** Yes. Okay . . . CONTACT LIGHT! . . . Okay. Engine stop. ACA out of detent. Mode control both auto. Descent engine command override off. Engine arm off. Four thirteen is in.

**CAPCOM:** We copy you down, Eagle.

**Armstrong:** Houston, Tranquillity Base here . . .  
THE EAGLE HAS LANDED.

**Leader:** Let us lift our glasses to the flight of the Eagle.

**Narrator:** Once settled, all systems were checked out to ensure that it was safe to stay for the planned time. Then, preparation began for the historic first walk on the surface of the Moon.

At 109 hours, 2 minutes, over six hours after landing on the moon, the Eagle's hatch was opened. In his space suit, Armstrong crawled backward onto the porch of the lander. As he backed down the first few rungs of the ladder he activated the television cameras, allowing millions on Earth to share the momentous event.

**Armstrong:** I'm at the foot of the ladder. The LEM footpads are only depressed in the surface about one or two inches. Although the surface appears to be very, very fine grained, as you get close to it, it's almost like a powder. Now and then, it's very fine . . .

I'm going to step off the LEM now . . .

THAT'S ONE SMALL STEP FOR (A) MAN . . .  
ONE GIANT LEAP FOR MANKIND.

**Leader:** On July 20, 1969 AD, at 109 hours, 24 minutes, 15 seconds, four and a half days after leaving Earth, Armstrong took the first step onto the surface of another world. Let us toast this historic event.

---

*(Normal participant reading rotation resumes)*

While on the Moon the astronauts gathered rock specimens and deployed scientific instruments. During a televised ceremony they planted the flag of the United States of America and then unveiled a plaque which read:

*Here men from the planet Earth first set foot upon the Moon.  
July 1969 A.D.  
We came in peace for all mankind.*

Half an Earth day later the astronauts readied the Eagle for the ascent from the lunar surface to begin their return to Earth. With Columbia in the proper position for lunar orbit rendezvous, the Ascent Module of the Eagle fired its engine and climbed into orbit leaving the Descent Module behind.

At 127 hours, 45 minutes into the mission, Eagle successfully rendezvoused and docked with Columbia. After the astronauts and their treasure of lunar soil were safely aboard Columbia, the Eagle, its job complete, was separated from the Command Module.

Shortly before the 135-hour point, a Service Propulsion System burn accelerated the Columbia to escape the Moon's captive gravitation and placed it on a homeworld-bound trajectory.

For a little over two days Columbia accelerated toward the Earth where, after enduring the fiery entry into the atmosphere, it was slowed by parachutes and splashed down in the Pacific Ocean. The Command Module and crew were then recovered by the aircraft carrier, USS Hornet.

The mission was a success. The astronauts were considered heroes by people all over the world. The Moon rocks were shared and studied by scientists around the world, and the Command Module *Columbia* was put on display in a place of honor in the Smithsonian Museum in Washington D.C.

**Leader:** Let us lift our glasses to commemorate the Mission of Apollo 11.

**Leader:** We now commence the feast to celebrate the wondrous accomplishments of the human beings of planet Earth, and the first landfall on another shore in the infinite sea of the universe.

*(Dinner is served)*

## EPILOGUE

*(Following dinner)*

**Leader:** Today we have told the story of the creation and evolution of the universe, Earth, life, and technology, and recounted the story of our first landing on another world, the moon of planet Earth.

And so, what has been before leads forward to what is now, and what will be . . .

We recognize that our destiny is to inhabit the stars, stepping forth from our blue and white homeworld to fill the galaxy:

- Knowing that life is precious and fragile, and that sentient life is a treasure of the universe, we seek to understand and protect that life . . .
- Being creatures of finite span in an infinite universe, we seek to seed our kind throughout this universe, creating new homelands, extending our reach, and guaranteeing our survival as a species . . .
- Being creatures of wonder and abstraction, we seek to fill our minds with the understanding of the universe . . .
- Being creatures of flesh and blood, we seek the resources for an abundant life within this universe . . .
- Being creatures of caution and aggression, aware that other sentient life may exist, we proceed intelligently on a path as yet untrod by humankind . . .
- Being creatures of unlimited vision and extensive hope, we embrace the lengthening of full life and stand resolute in the face of mortality . . .
- Being creatures of revelry and players at the paradox, we seek to fill our lives with joy and pleasure, following with amusement our own venturing.

And so, for joy and for wonder, to protect, to grow, to explore and to live, we step onto an unfolding path that leads outward from our lone homeworld.

We begin this journey with the filling of the near space surrounding our homeworld, Earth . . . extending ears, eyes, hands, and finally building homes and work places . . . filling the empty spaces with life.

We will create human outposts throughout our solar system, which will become cities floating free between, and set upon and within Earth's sister worlds. And these cities will form a community that will bring the wealth and variety of resources, knowledge, and adventure, within Sol's System, to the children of the Earth.

And, as our own system is filled with the variety of humankind, we will lift our eyes to the far horizon, that which has drawn us first across, and inevitably up from the homeworld and has filled our minds with wonder and desire, and we will sail forth to the stars . . .

**Assembled:** To the stars!

# Commemoration

by  
Judith L. Freed  
August 11, 1996

Seven candles burning bright  
Six are red and one is white  
We gather here upon this date  
Man on the Moon to celebrate

On the 20th of July in '69  
A drama as to stretch the mind  
Man from Earth his foot did place  
Upon the Moon in Outer Space

How did Man come to such a task  
To reach this goal that we may ask  
Because of Men who dared to dream  
This Cosmic plan did Science scheme

A journey such as none had done  
The quest of who would be the one  
To touch the Moon and place the flag  
The race was on no time to lag

To land upon another World  
The mind of Science would be hurled  
And leave our flag for all to know  
That dreaming dreams can make it so

To Armstrong Aldrin Collins too  
With courage and hope these precious few  
Did take us there upon that day  
The Moon no longer dreams away

So we remember from now on  
That Man has been and Man has gone  
To dream and seek and hope and search  
And bring us back the Universe

### The Cast (in order of appearance)

---

Gutenberg, Johann	German printer	1397 - 1468
Copernicus, Nicholas	Polish astronomer	1473 - 1543
Bacon, Sir Francis	English philosopher	1561 - 1626
Galilei, Galileo	Italian astronomer	1564 - 1642
Kepler, Johann	German astronomer	1571 - 1630
Newton, Sir Isaac	English mathematician philosopher	1642 - 1727
Leibnitz, von, Gottfried Wilhelm	German mathematician	1646 - 1716
Franklin, Benjamin	American scientist	1706 - 1790
Coulomb, Charles-Augustin de	French physicist	1736 - 1806
Watt, James	Scottish inventor	1736 - 1819
Ampère, Andre Marie	French physicists	1775 - 1836
Gauss, Karl Friedrich	German mathematician	1777 - 1855
Faraday, Michael	English physicist	1791 - 1867
Carnot, Nicolas Leonard Sadi	French physicist	1796 - 1832
Darwin, Charles Robert	English evolutionist	1809 - 1882
Joule, James Prescott	English physicist	1818 - 1889
Kelvin, William Thomson	English physicist	1824 - 1907
Maxwell, James Clerk	Scottish physicist	1831 - 1879
Mendelyeev, Dmitri Ivanovich	Russian chemist	1834 - 1907
Edison, Thomas Alva	American inventor	1847 - 1931
Bell, Alexander Graham	American scientist	1847 - 1922
Tesla, Nikola	American (Yugoslavia) physicist	1856 - 1943
Curie, Marie Skiadowska	Polish chemist	1867 - 1934

### The Cast (in order of appearance)

---
